

GLOBAL FRIDAY PRESENTS

Friday, January 29, 2021

Eric Lede

Human Geographer
City of Darwin, Northern Territory, Australia

The broad impacts of climate change – from the environmental changes and the rapid transition to a society with net-zero greenhouse gas emissions – will permeate every aspect of our lives. This future is not *nearly here*: it has already arrived. The opportunities and damages that climate change presents are already being navigated within every sector of our society. The forces that are coercing this rapid response to climate change, however, are not exclusively of environmental origin.

From an Australian perspective, Lede will describe the key forces that are rapidly coercing our society to reabsorb the greenhouse gases that we are pumping into our atmosphere. He will offer unique insights into how these forces flow through unexpected pathways with examples drawn from across northern Australia – from capital cities to some of the most remote Indigenous communities in Australia.

Coerced into Climate Action from the Unexpected Recesses of our Society: An Australian Perspective

12:00 – 1:30 PM
